Aryaman Shah
(781)-526-8565 | aryamansh04@gmail.com | Arlington, MA | www.linkedin.com/in/shah-aryaman

Aspiring software engineer with a strong foundation in computer science, driven by a passion for problem-solving, interested in web and software development to develop technical skills further while creating impactful solutions that contribute to society.

EDUCATION

University of Massachusetts Lowell | Lowell, MA Expected Graduation: May 2027
Major: Computer Science – General
Overall GPA 3.1
Related Courses: Assembly Language, Data Structures, Object-Oriented Programming, Logic Design, Computer Architecture, Organization of programming languages, Computing for Health and Medicine
Activities: Intramural Sports, ACM Club.

Work Experience

Tatte Bakery & Cafe | Arlington, MA April 2025 – Present
- Managed high-volume customer flow during peak rush hours, demonstrating the ability to work efficiently and accurately under pressure.
- Collaborated with a team to ensure timely delivery of orders and maintain a clean, organized, and presentable environment.
- Developed strong communication skills by interacting directly with customers and resolving issues to ensure a positive experience.

Uplifty AI | Remote November 2025 – April 2026
- Developed and maintained cross-platform iOS and Android mobile applications using React Native, ensuring performance, usability, and a clear UI design is delivered.
- Worked with cross-functional teams to implement new features while improving existing mobile workflows.
- Debugged and optimized mobile code to enhance user experience.

Skills

Programming Languages: C/C++, JavaScript, HTML, CSS, Python, React Native,
Software: VS Code, Visual Studio, Android Studio

Languages: English (Fluent), Nepali (Native)

Projects

Planet Simulator March 2025
- Developed and designed a planet simulator that displayed and portrayed some of the orbits and rotations of planets within our universe over time.
- Used C++ to implement core functions, utilizing complex mathematical calculations to model planetary orbit and rotations.
- Used SFML to render the planets and ensure a smooth, accurate representation of physics and planets was shown.

Smart Email Sorter October 2025
- Built a modular Python application that classifies Gmail messages into categories, using a Naive Bayes classifier and TF-IDF text vectorization.
- Integrated Gmail API to fetch messages, parse senders and subjects, and apply category-specific labels within Gmail
- Implemented persistent model storage with joblib, structured logging for accuracy tracking and pipiline activity, and robust error handling for API calls.

Leadership & Activities

Association for Computing Machinery (ACM), UMass Lowell
- Director of Partnerships: Created networking opportunities for members while also coordinating events that connect students with alumni and industry professionals.
